21st National Biomedical & Clinical Engineering Conference
November 28, 2019

Speaker Biography

Stephen L Grimes, FHIMSS FACCE FAIMBE AAMIF

Principal Consultant

Strategic Healthcare Technology Associates, LLC

Mr. Grimes has over 40 years' experience working with independent service organizations, academic medical centers, healthcare consulting and research firms.

He is a recognized authority and frequent speaker and author on topics ranging from future challenges facing the technology support industry to healthcare technology convergence, medical device security, risk management and quality management issues.

He recently co-edited/co-authored AAMI's *Medical Device Cybersecurity Guide for HTM Professionals* and teaches a graduate-level engineering course in medical device cybersecurity at the University of Connecticut. He has been involved in the development of many of the industry's key healthcare technology management (HTM) standards and has also served as a HTM consultant to the World Health Organization (WHO) and Pan American Health Organization (PAHO).

He is a fellow of *Healthcare Information and Management Systems Society (FHIMSS)*, the *Association for the Advancement of Medical Instrumentation (AAMIF)*, and the *American Institute of Medical and Biological Engineering (FAIMBE)* and the *American College of Clinical Engineering (FACCE)* where he is also a past president.

He is also a recipient of AAMI's annual *Healthcare Technology Management Leadership Award*, ACCE's *Lifetime Achievement Award*, and the ACCE-HIMSS annual *Excellence in CE-IT Synergies Award*. In 2019, he was inducted into the ACCE's *Clinical Engineering Hall of Fame*.

The Greatest Challenges We Face in Supporting of the Latest Generation of Healthcare Technology

For several decades, healthcare technologies have increasingly been incorporating information as well as medical technologies. While this has contributed to an evolution of healthcare technologies that are highly sophisticated and capable (e.g., robotics, 3D imaging & printing, systems-of-systems, cloud-based processing/storage, AI/AR technologies, telehealth), it has also greatly challenged those responsible for ensuring these same technologies are readily available and effectively supported. One of the principal challenges is that support has traditionally (and still largely) comes from two disparate groups: clinical engineering services and IT services ... groups with decidedly different cultures and operating styles. While some larger and more progressive organizations may have established effective collaborations between CE and IT, those programs are in the minority and have not yet been translated into broad guidelines that can be effectively adopted on a wider industry basis. A second challenge comes from the fact that the changes in knowledge, skills and abilities (KSAs) required by support professionals is not keeping pace with the exponential evolution in healthcare technology. A third challenge is that the healthcare technology support services are often under resourced, having insufficient number and an inappropriate blend of healthcare technology managers, engineers and engineering technicians.

This session will further describe the nature of those challenges and the steps that our industry should now be taking if it hopes to address these issues in any timely manner.

Evolution of the industry

$\text{New CE/HTM Roles} = f(\text{New Technology})$

CE/HTM Roles are defined by the support requirements of medical technology

New Technology \neq Old Technology \therefore New CE/HTM Roles \neq Old CE/HTM Roles

Points to make

- **Trends in technology ...**

- increasing convergence (i.e., medical, information & communications technologies)
- increasing complexity ... growing number of Systems of Systems (SoS)
- increasingly capable (smart & software-based)

- **Need for Evolution of HTM Roles ...**

i.e., What roles are necessary to support selection, deployment, and support

- focus on changing roles
(not necessarily the same as historical roles because the needs are changing)
- continuous education required

Past and Future Trends in Healthcare Technology

Managing Convergence of Medical & Information Technologies

≈ 18 years ago

Medical devices became special purpose computers capable with multiple features capable of collecting, storing and analyzing large amounts of data

=

Managing Convergence of Medical & Information Technologies

≈12 years ago

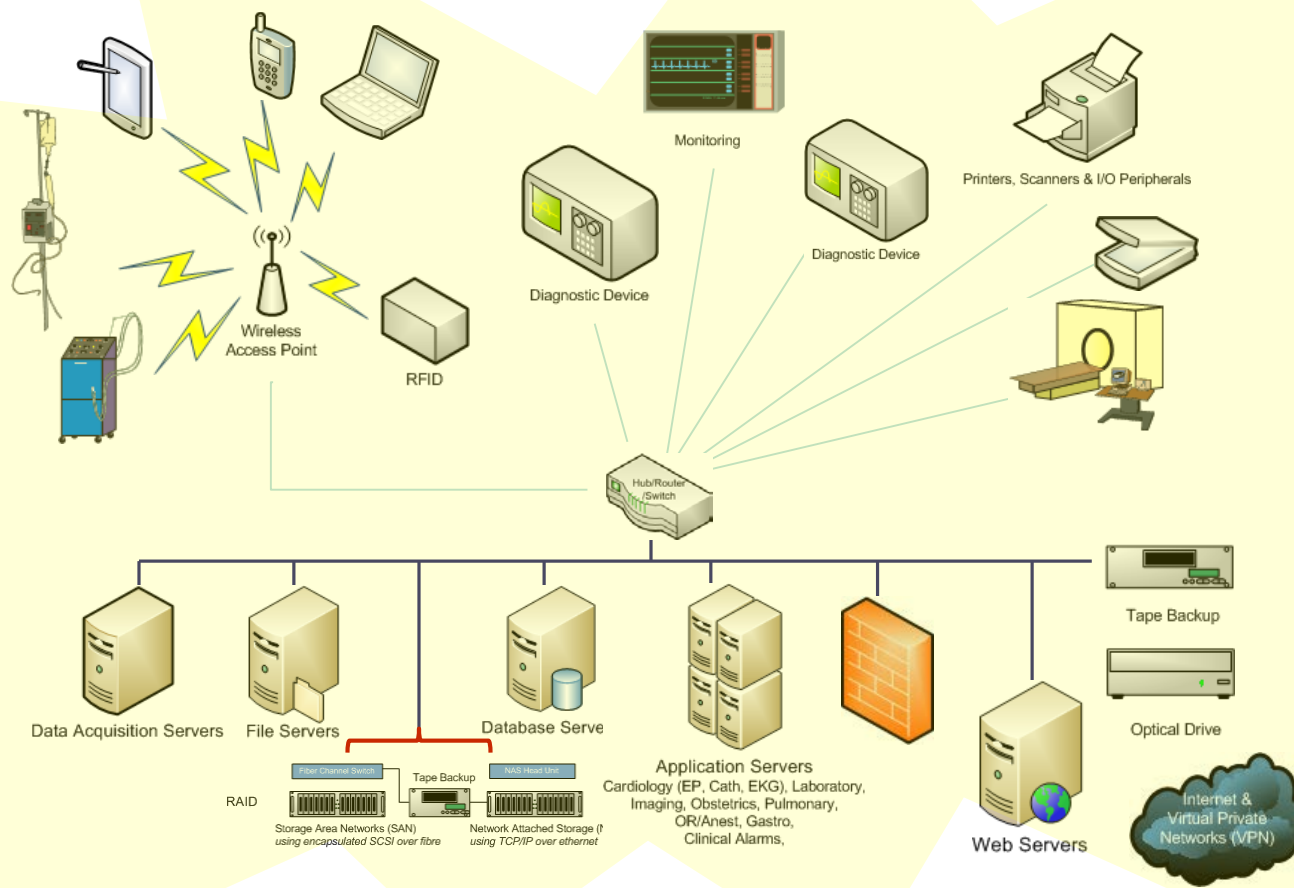

More medical devices became systems running on their own proprietary networks (box bound)

Managing Convergence of Medical & Information Technologies

between 7-12 years ago

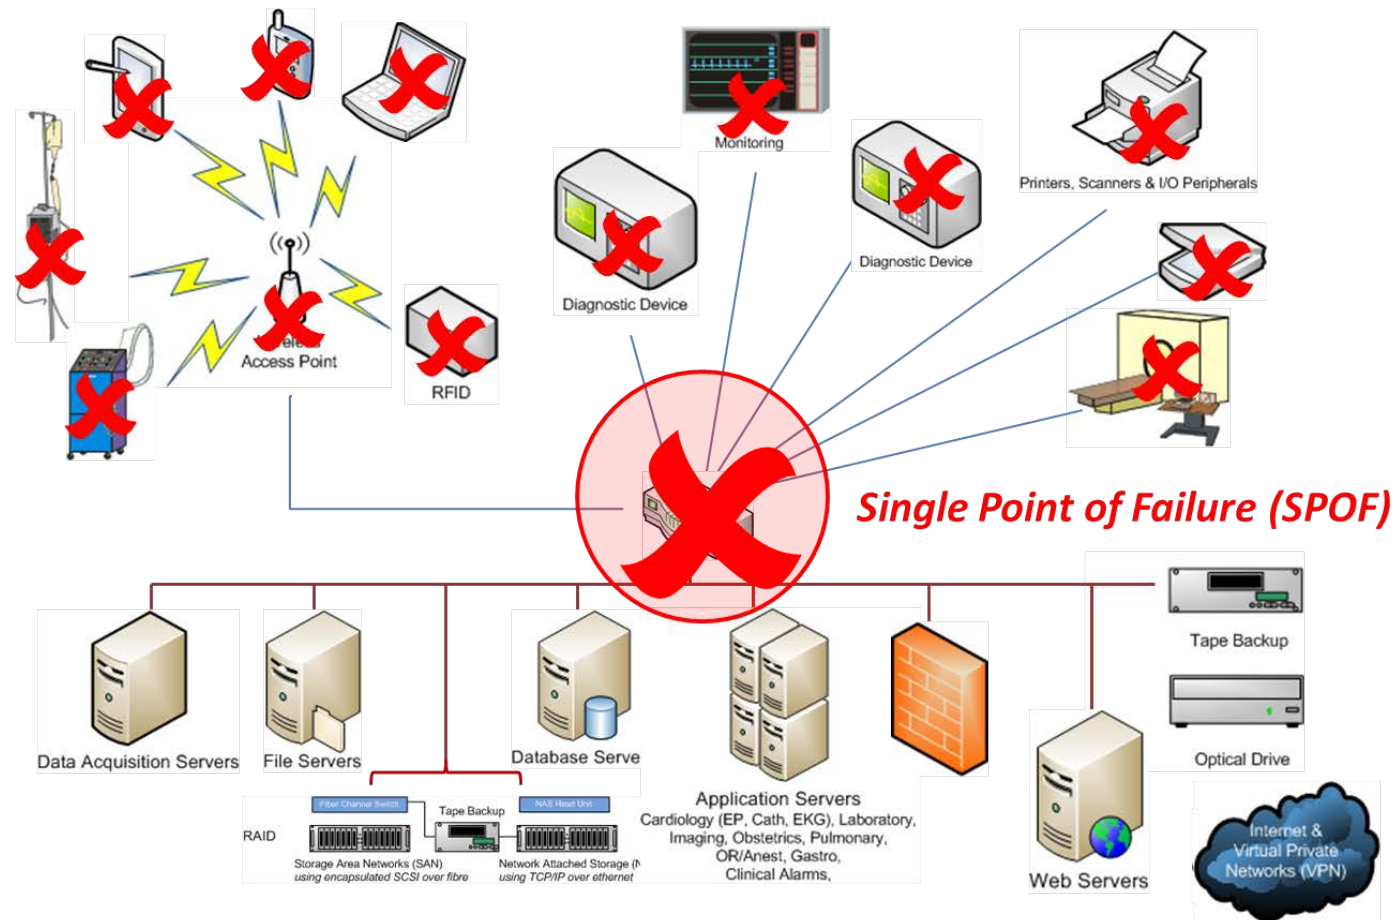

More medical devices & systems began migrating to enterprise networks (unbound)

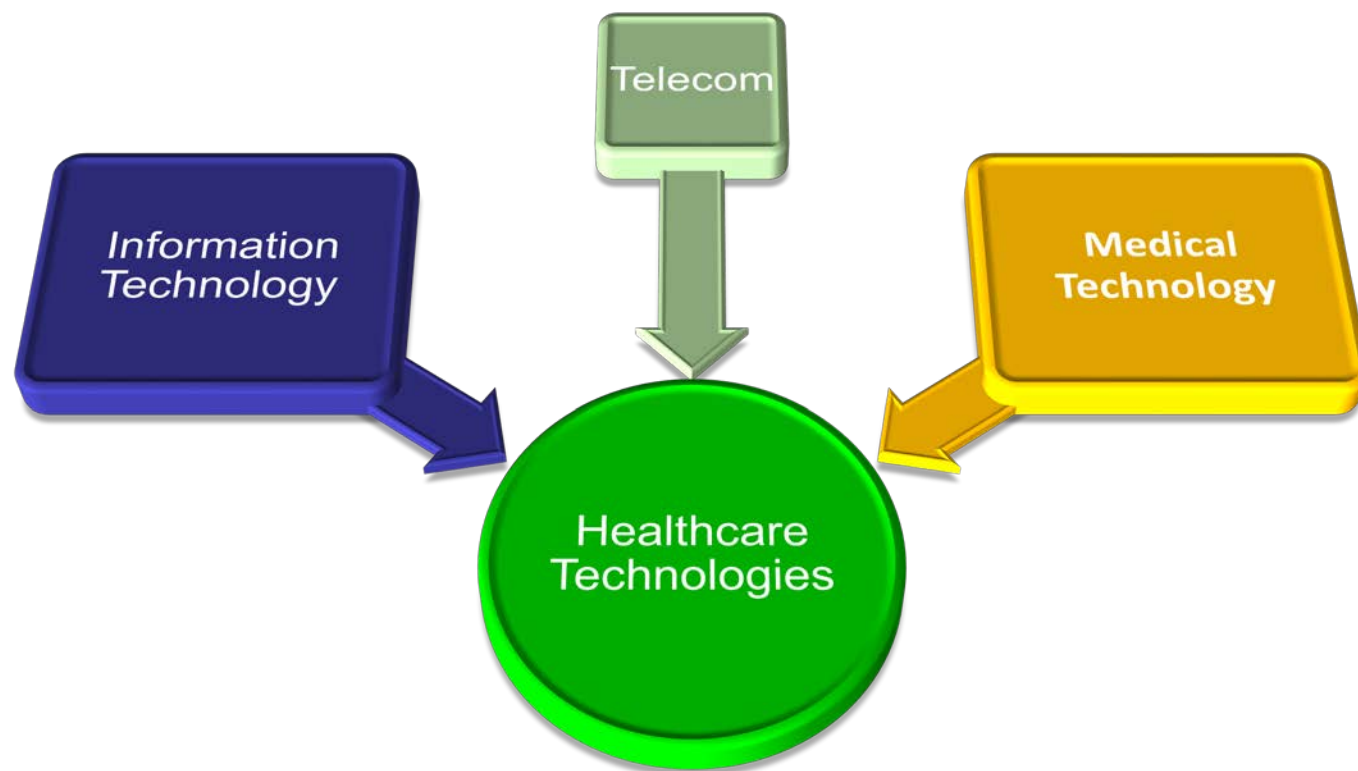

Managing Convergence of Medical & Information Technologies

7-12 years ago

Among the unintended consequences of medical devices on enterprise networks is the introduction of single points of failure (SPoF)

Since 2010
Convergence of Technologies has continued
Growing Number of Hybrid (i.e., Medical-Information-Telecom)
Healthcare Technology Systems

Future of Smart, Software Based Medical Technologies

Many traditional medical devices will be replaced by
Software-based “Smart” Medical Devices
Manufacturers are increasingly focused on software development

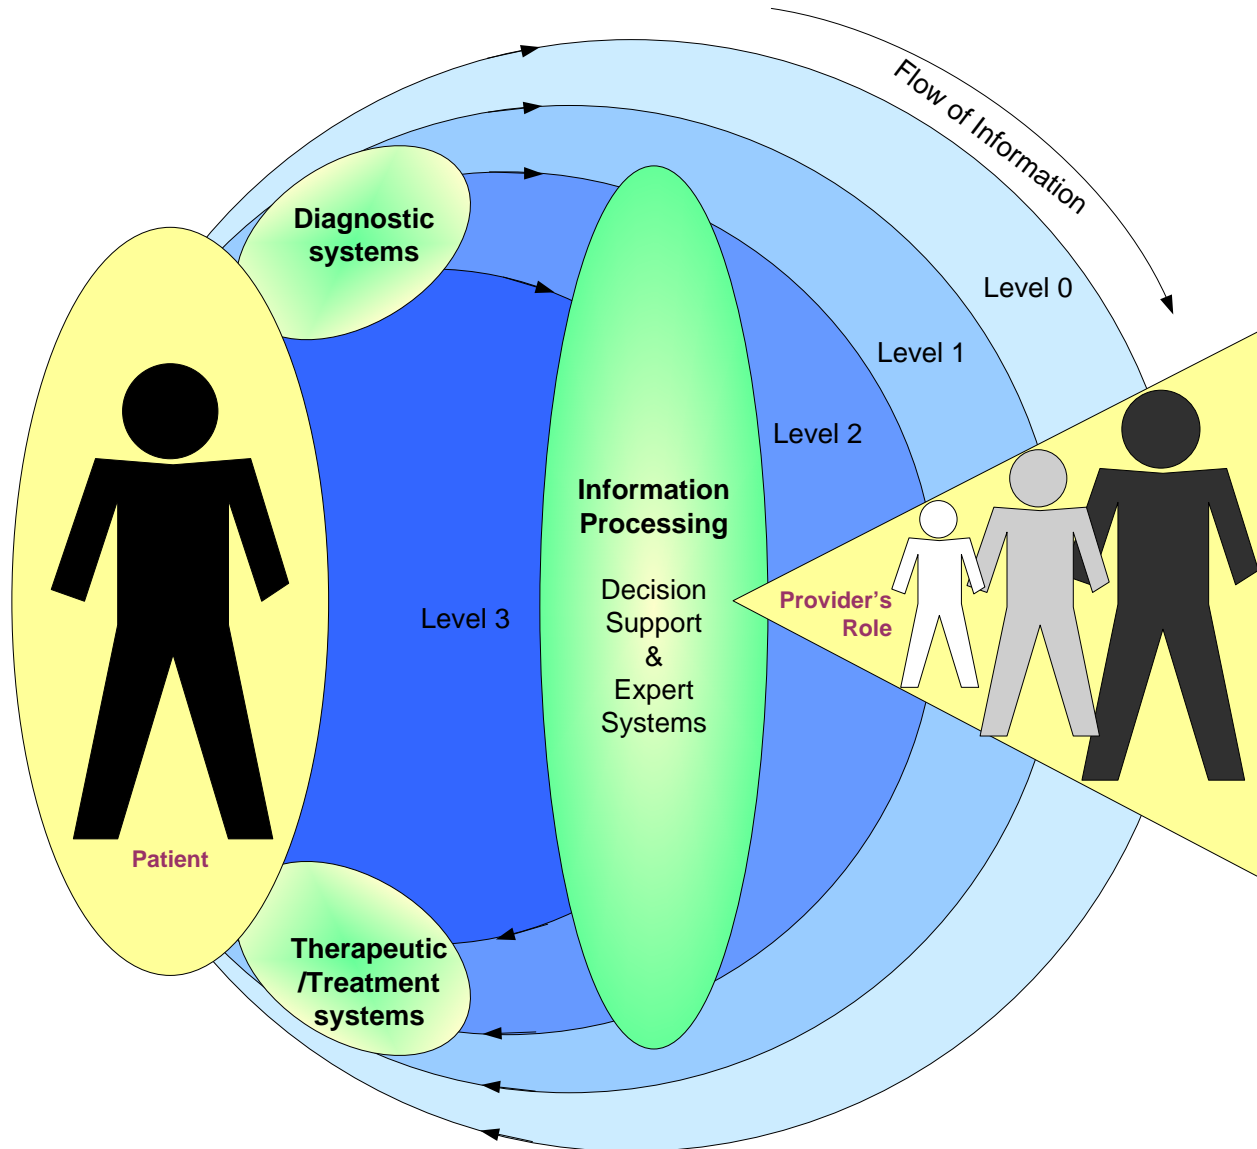

Examples of some technological advancements healthcare

- robotics
- 3D imaging & printing
- telemedicine & remote monitoring
- micro- and nano- technologies
- individualized medicine (including use of genomics)
- connected, systems-of-systems, and cloud-based solutions (including IoMT, 5G)
- clinical decision support (CDS) & expert systems
- artificial intelligence (AI)
- augmented reality (AR)

Evolution of Smart Healthcare Technology and the Impact on Provider Roles

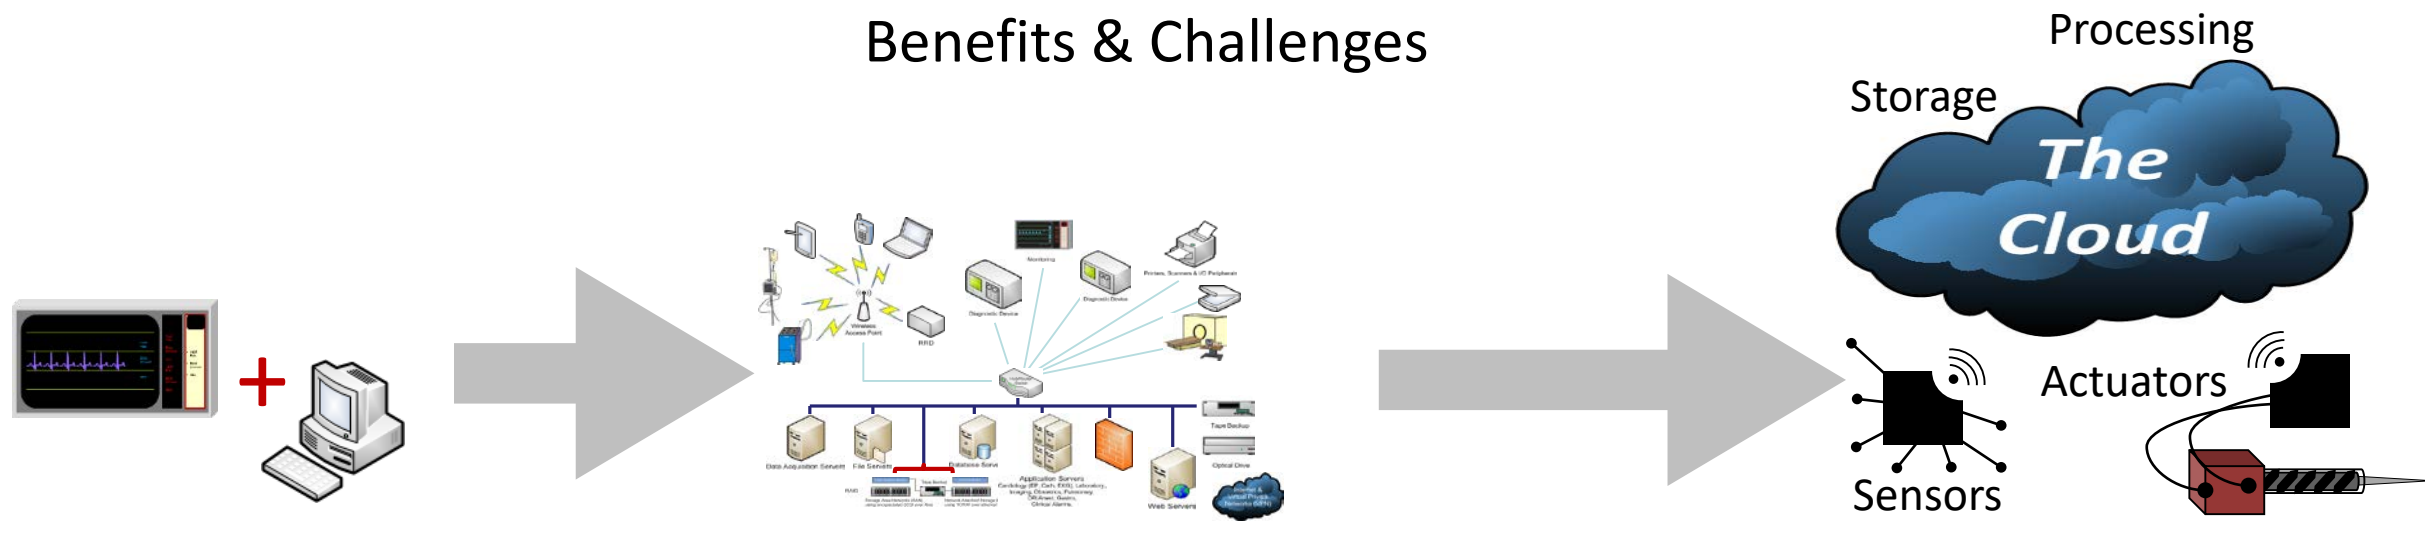

- 0) Clinician's direct observation and action in diagnosis and treatment
- 1) Diagnosis and treatment by clinician augmented by medical devices
- 2) Diagnosis and treatment by clinician further augmented by clinical decision support systems and medical devices
- 3) Diagnosis and treatment directly done by expert & clinical decision support systems and medical devices

Managing Convergence of Medical & Information Technologies

Benefits & Challenges

2009 2010 2011 2012 2013 2014 2015 2016 2017 2018 2019 2020 2021 2022 2023 2024 2025 2026

12% networked

23% networked

50% networked?

70-80% networked?

BENEFITS

- centrally managed
- increased capabilities (*faster, more reliable diagnosis & treatment*)
- self-diagnostic
- self configuring
- self repairing

CHALLENGES

- increased complexity (*requires systems support*)
- multiple SPOF
- multiple vulnerabilities

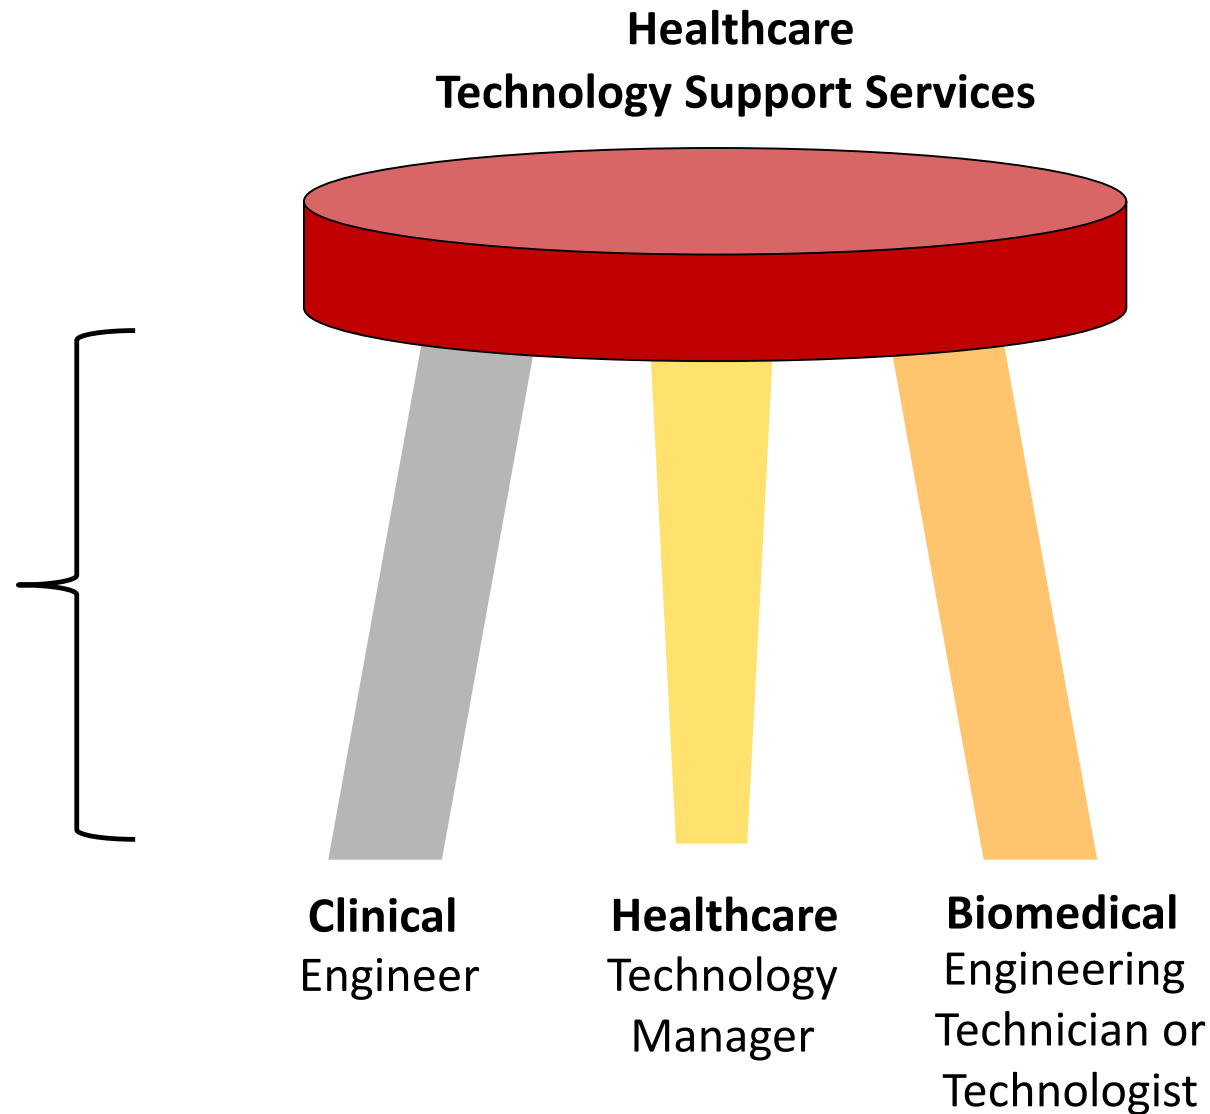

Trends in CE/HTM Roles and Career Paths

Required Technology Support Roles and their Evolution

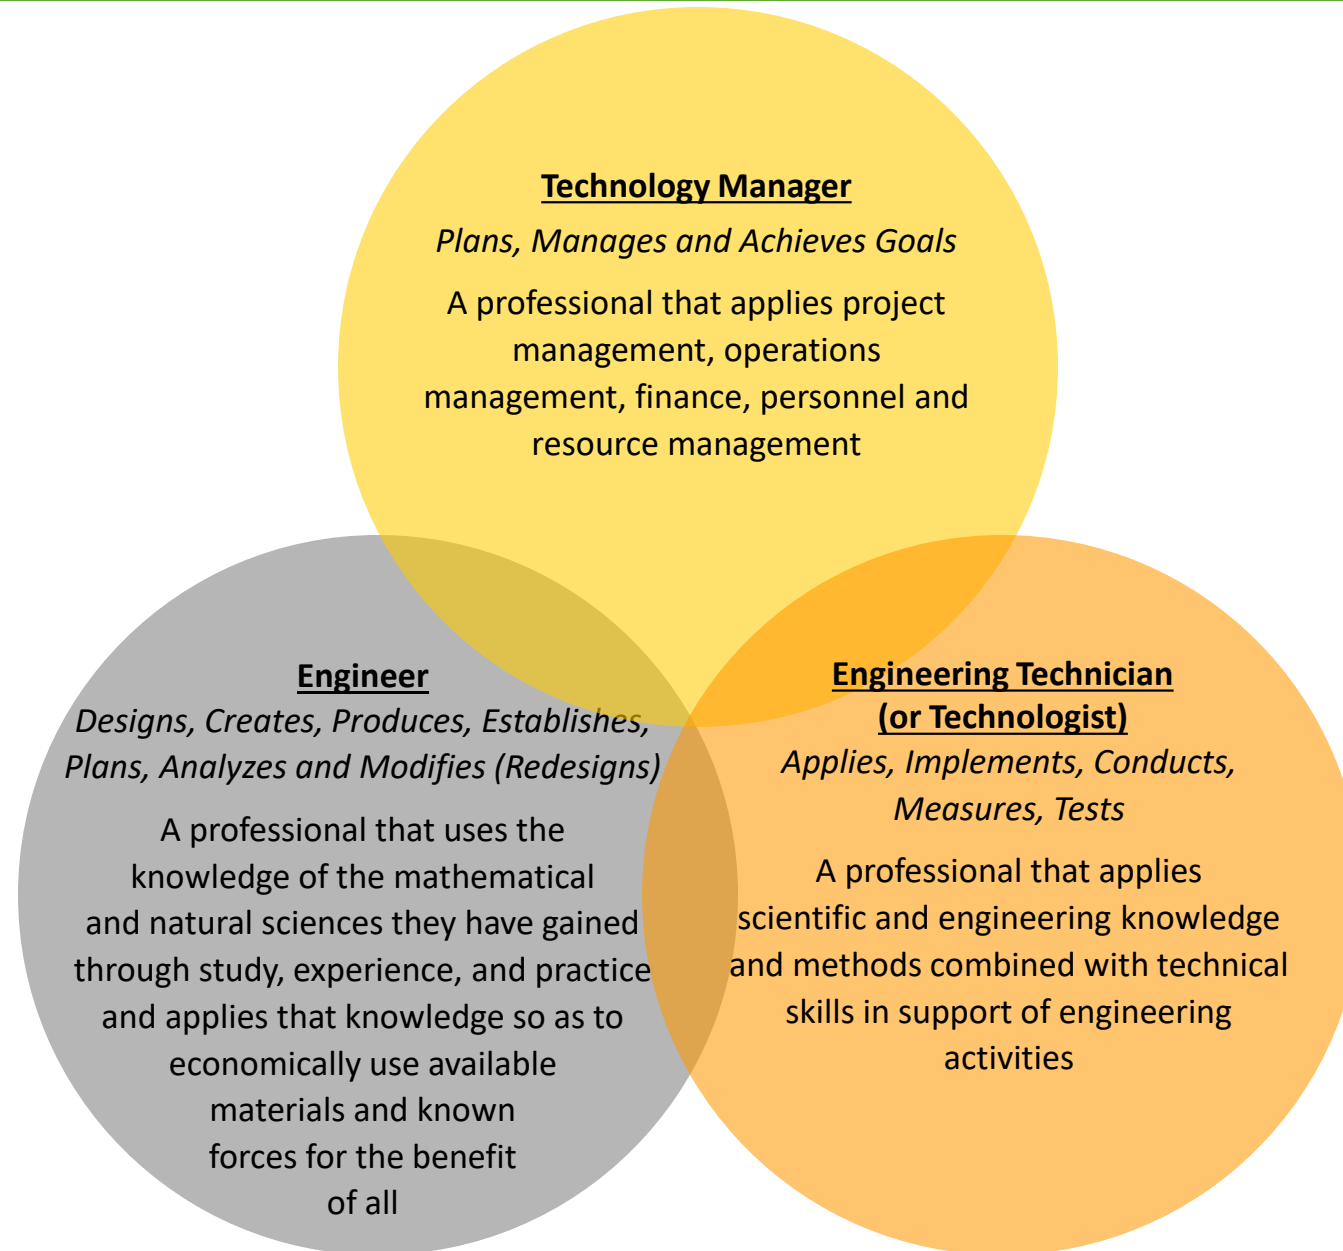

The Healthcare Technology Support Professional Paradigm

Three Roles that are the three legs of the **Healthcare** Technology Support Services Stool

Required Technology Support Roles and their Evolution

The Technology Support Professional Paradigm

Required Technology Support Roles and their Evolution

The Healthcare Technology Support Professional Paradigm

Healthcare Technology Manager

Plans, Manages and Achieves Goals

- ✓ Operations management
- ✓ Project management
- ✓ Finance
- ✓ Personnel & resource management
- ✓ Supplier management
- ✓ Quality management

Clinical Engineer

*Designs, Creates, Produces, Establishes,
Plans, Analyzes and Modifies (Redesigns)*

- ✓ Technology evaluation (i.e., safe, effective, reliable/resilient, appropriate)
- ✓ Data analysis and interpretation
- ✓ Systems, environment & process design (to assure continuous availability of safe & effective technology)
- ✓ System & device lifecycle management
- ✓ Standards interpretation & compliance
- ✓ Risk management

Biomedical Engineering

Technician (or Technologist)

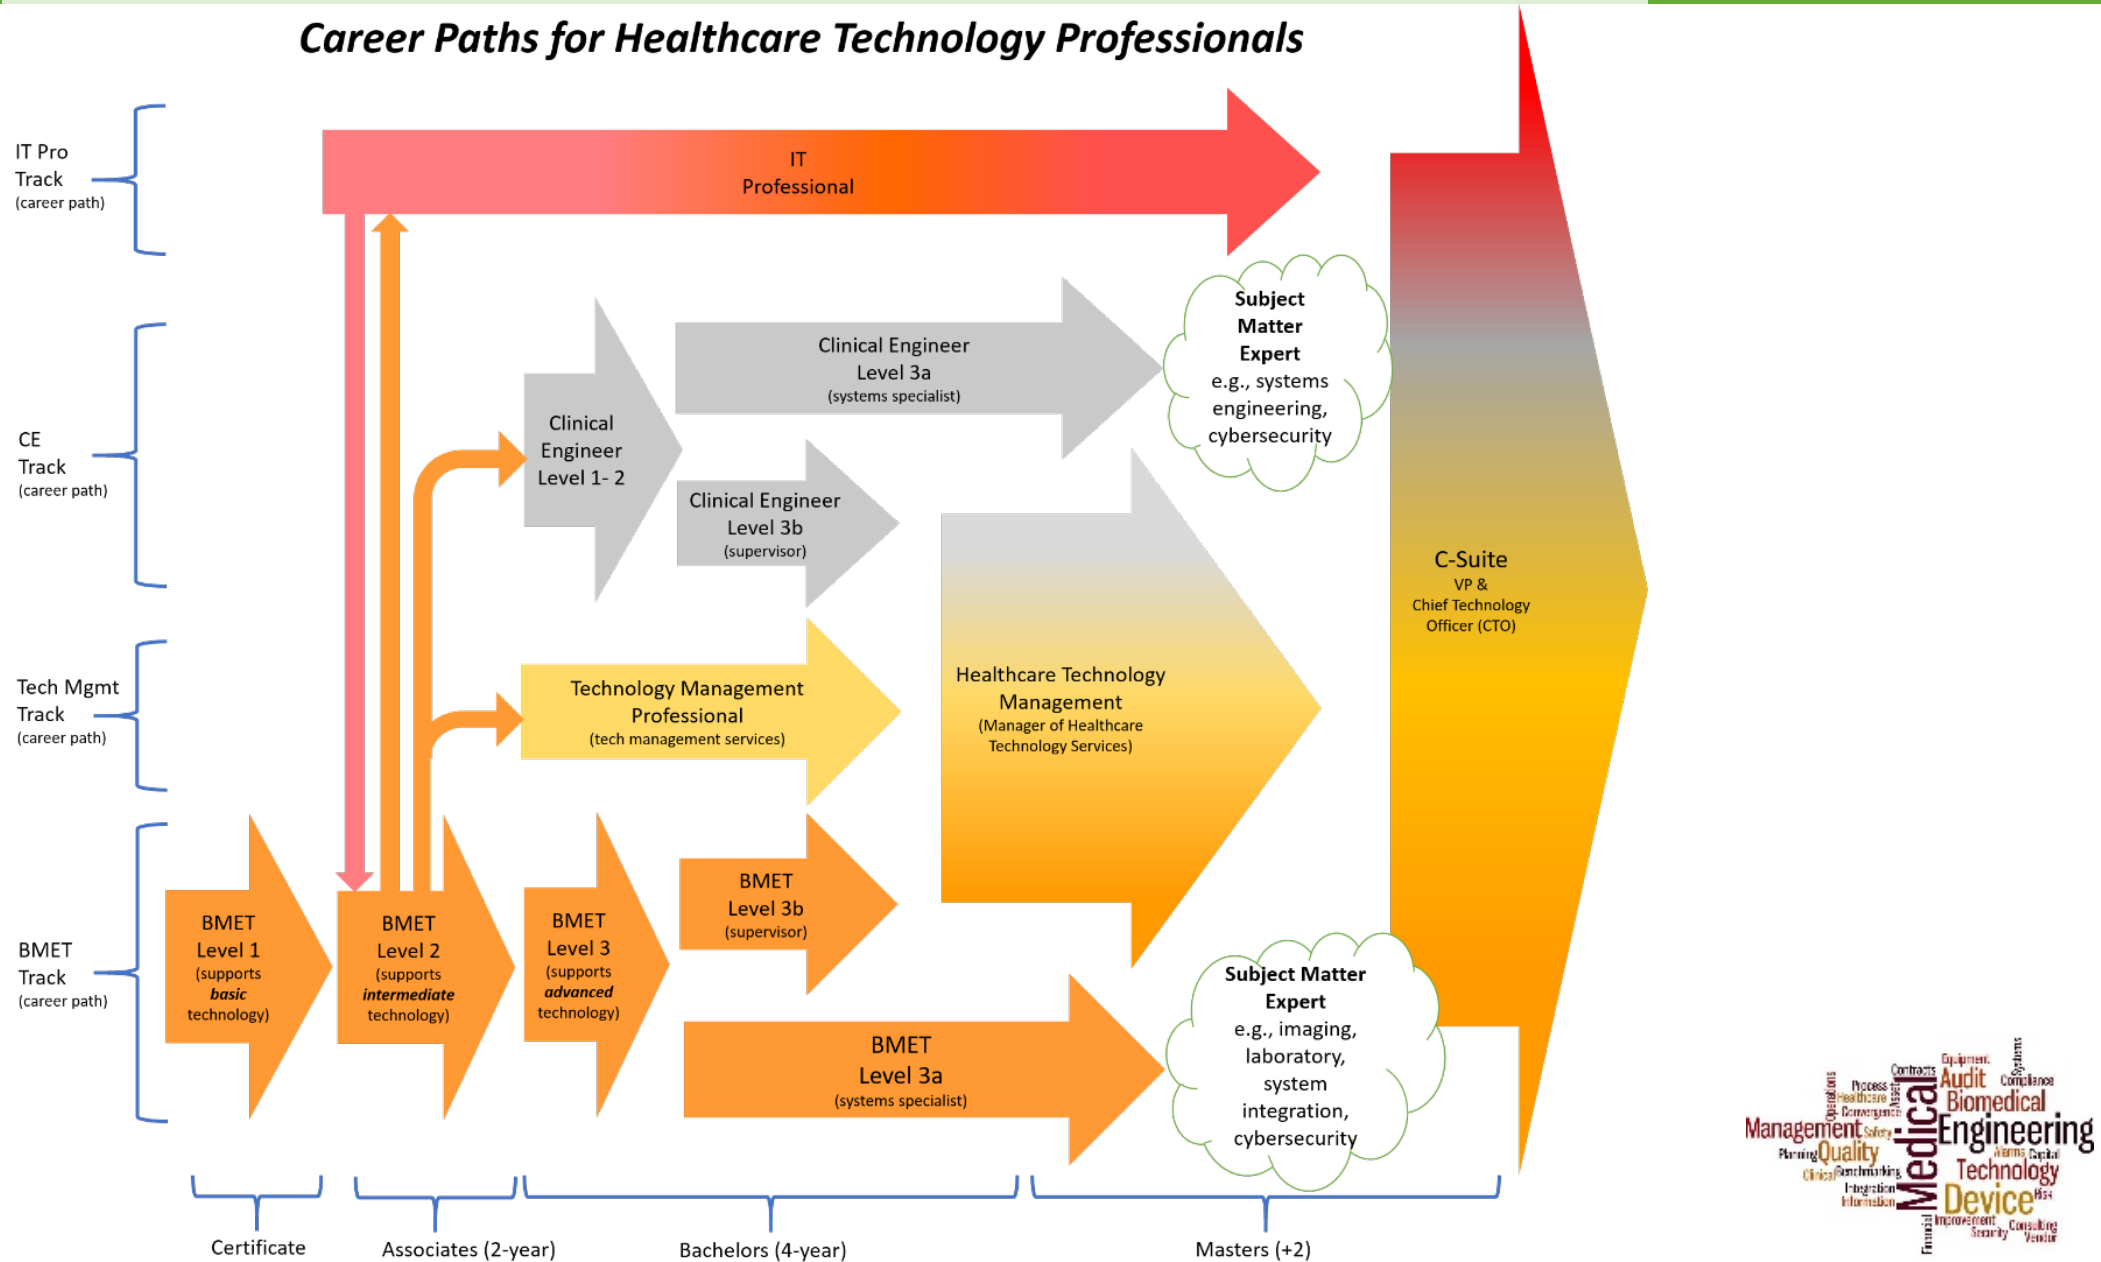

*Applies, Implements, Conducts,
Measures, Tests*

- ✓ Test & measurement
- ✓ Calibration/adjustment
- ✓ Troubleshooting
- ✓ Installation & configuration
- ✓ Conformance with policy/procedures and patient safety requirements

Required Technology Support Roles and their Evolution

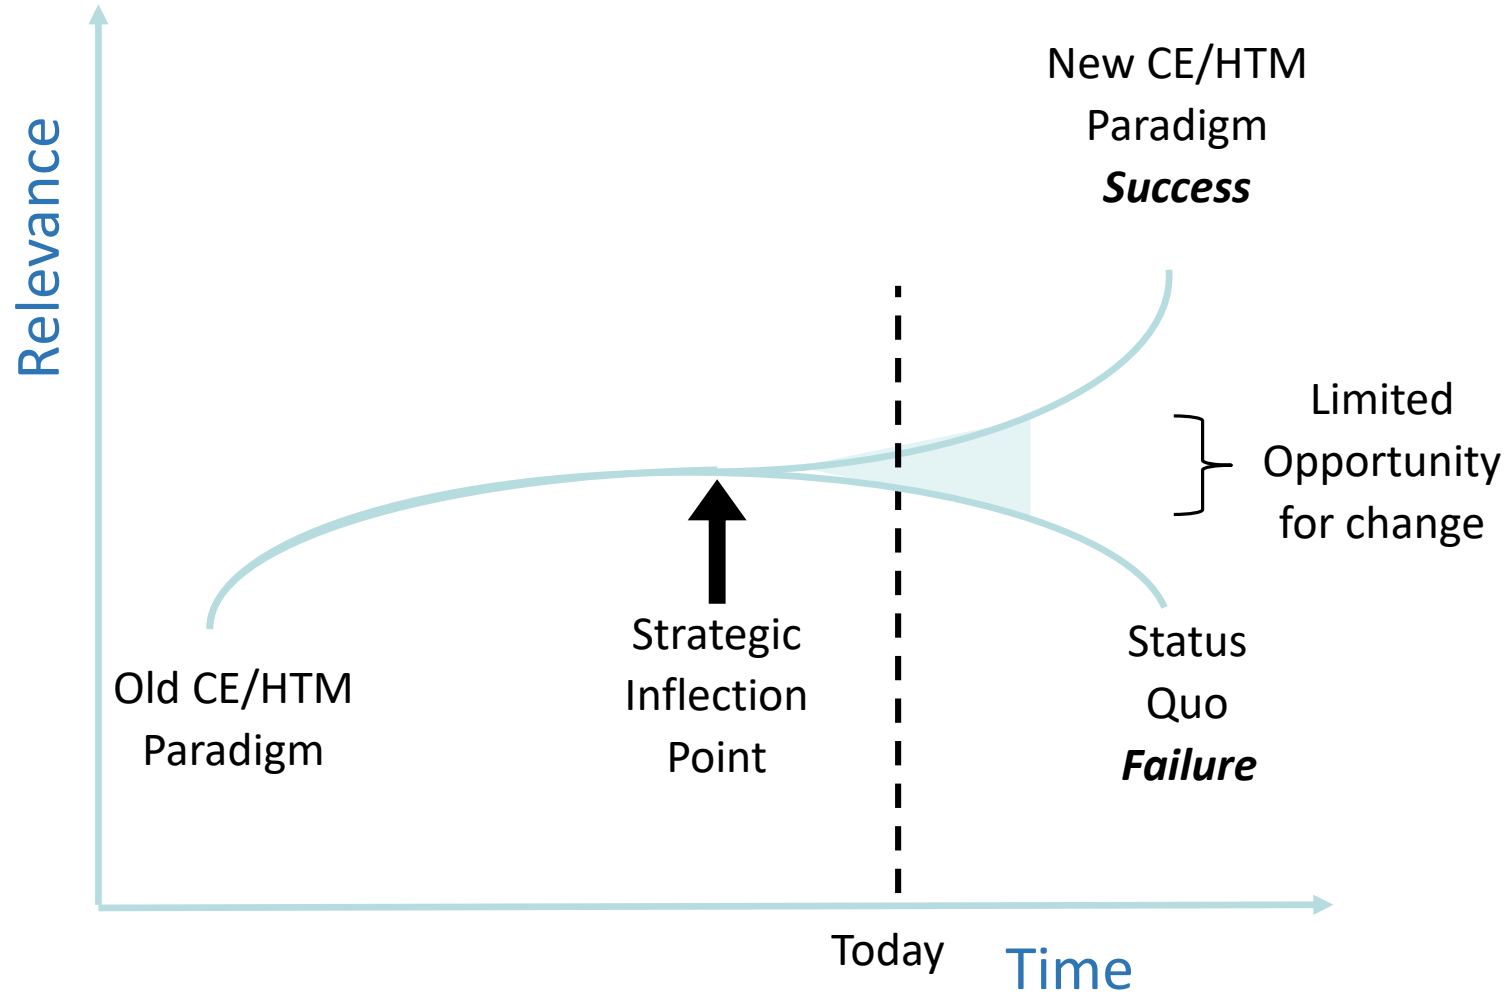

Career Paths for Healthcare Technology Professionals

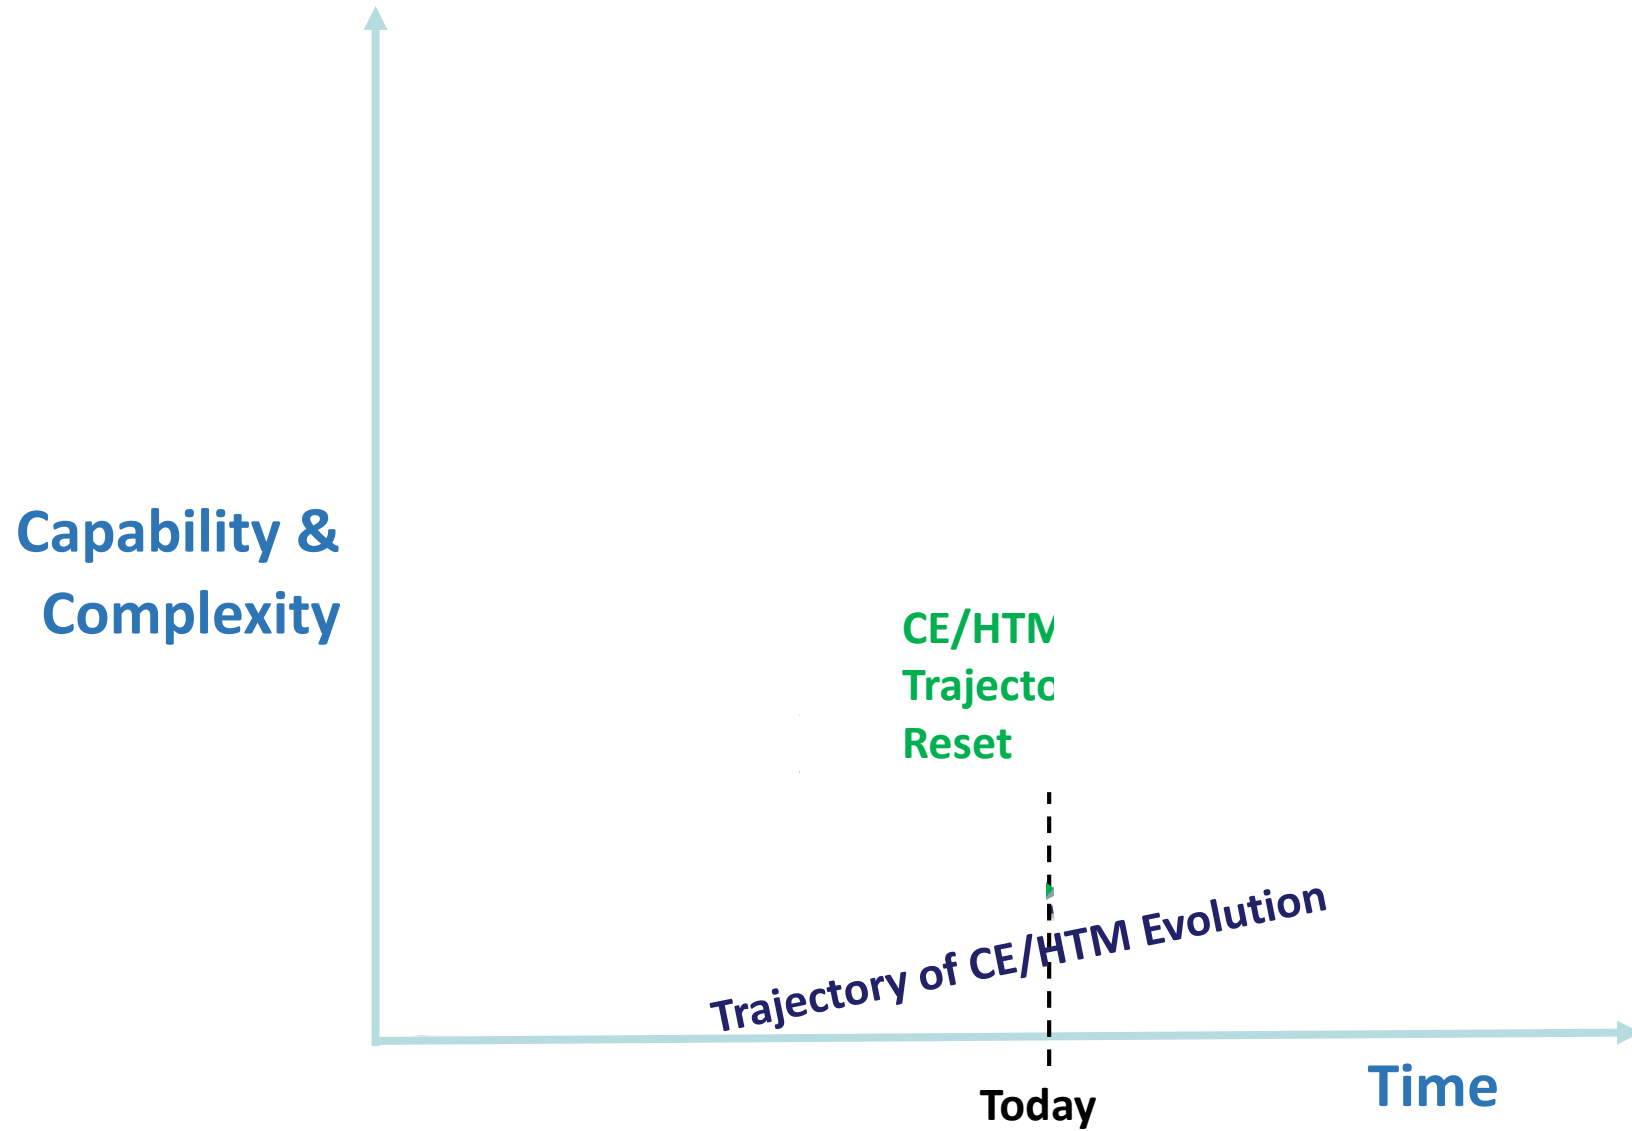

Major Challenges

At a Critical (“Strategic Inflection”) Point related to Survival of CE/HTM

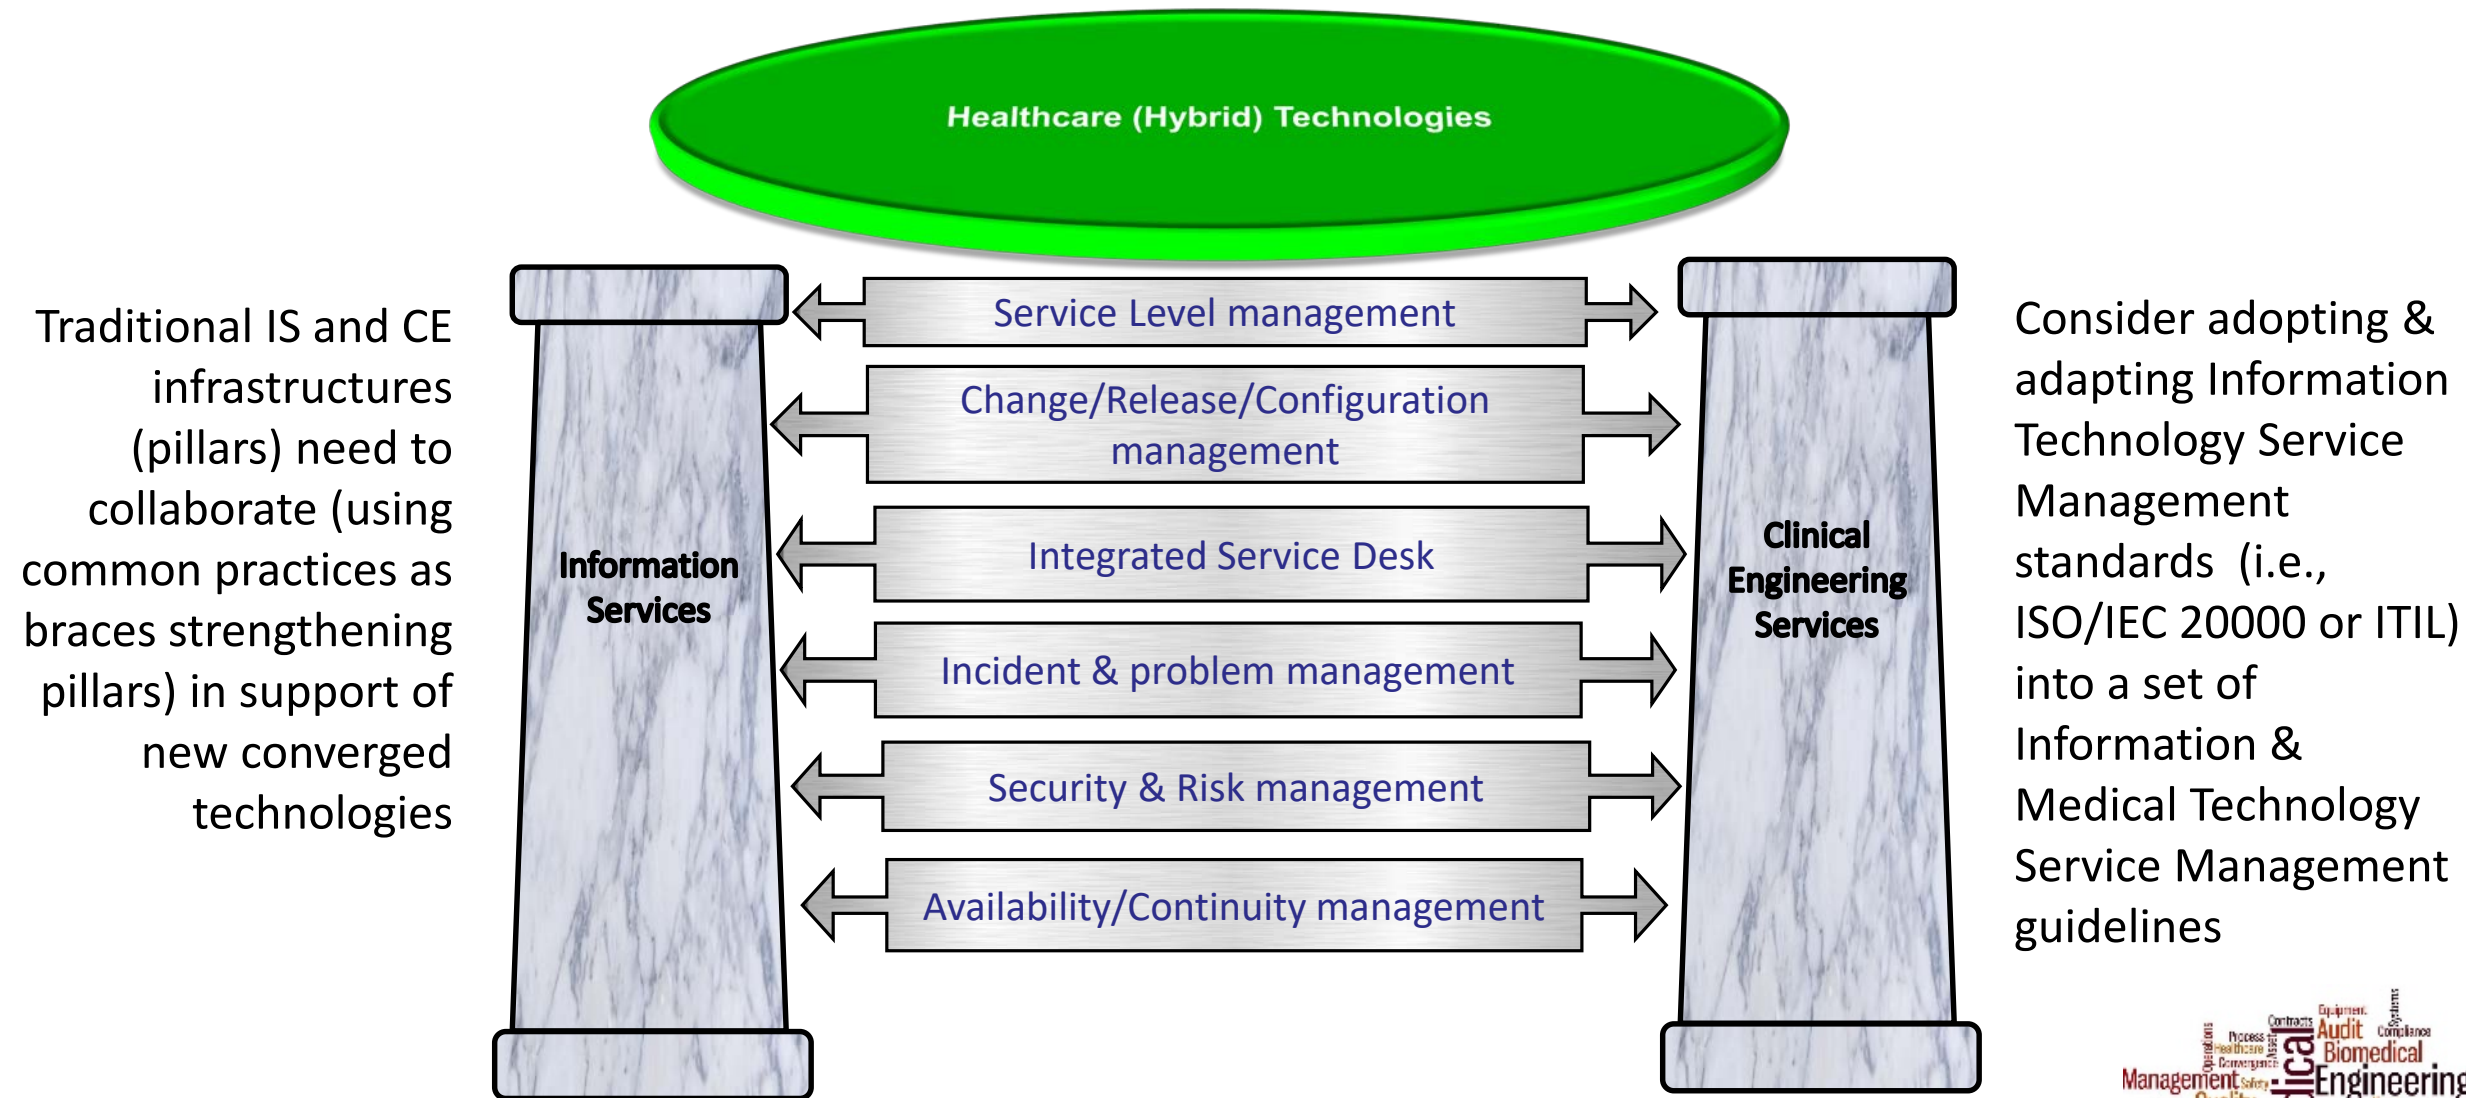

Trends in Evolution of Healthcare Technology and Impact on CE/HTM Roles

New CE/HTM Approaches to Explore

Changes in Reporting, Organization & Infrastructure necessary to manage converged technologies

Changing CE/HTM Roles

- CE/HTM & IT need to take steps necessary to modify their trajectory in a manner that better aligns and supports converging & evolving technologies
- redefine CE/HTM roles (originally defined decades ago) in a manner that reflects how best to apply CE/HTM (i.e., engineering, engineering technology and technology management) education, skills and experience to meet both today's support needs and future support needs
 - better define education, skill, experience and certification requirements for the CE/HTM professionals so the in position to fill new roles
 - develop guides and standards that define CE/HTM & IT roles & responsibilities in a manner that ensures seamless collaboration and support of increasingly integrated, hybrid systems
 - identify key organizations that have best potential to facilitate necessary changes to technology support including developing underlying stakeholder roles & relationships

Technology will evolve at a pace that will require CE/HTM professionals to commit to continuous education if they are to remain relevant

- Completion of traditional education will no longer be sufficient for new HTM roles
 - AAS for engineering technicians
 - BSET for engineering technologist
 - BSE, MSE for engineers
- Continuous education will be required
 - additional college and university-based education
 - certificate programs
 - specialty (industry-based) programs
- Education in new role elements will be required as traditional roles change and some previously required skills and expertise become obsolete

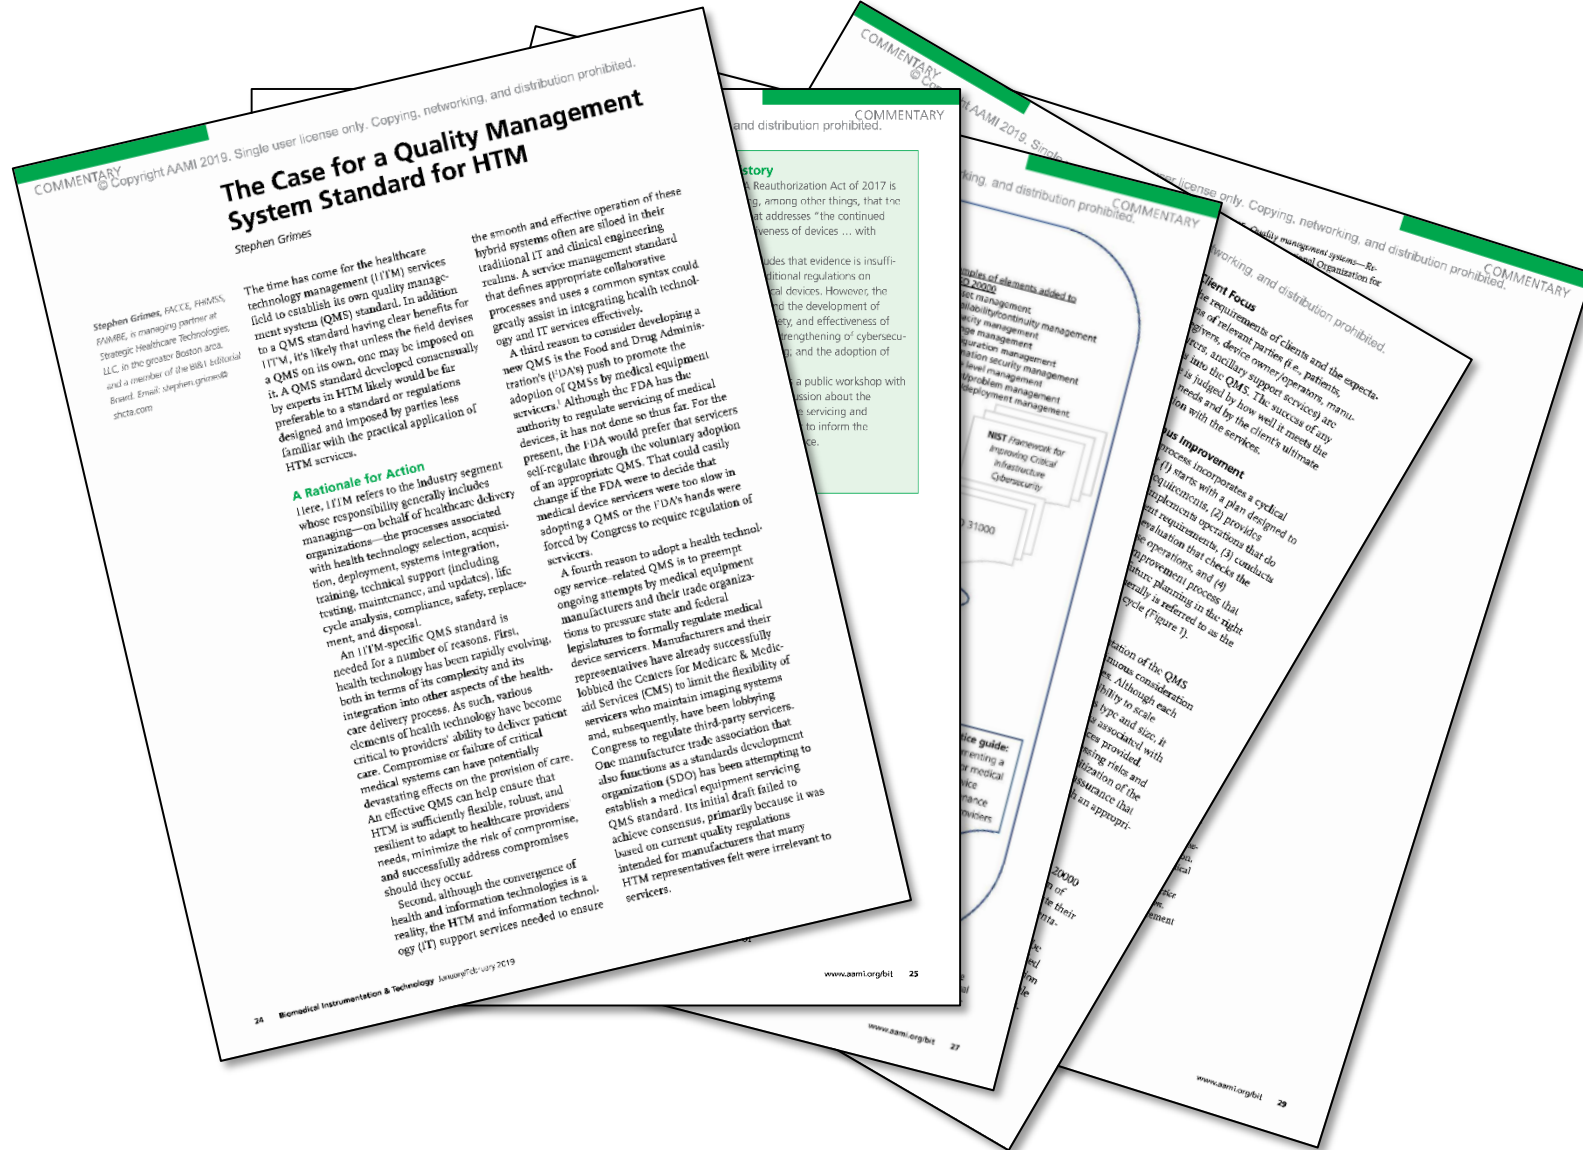

Summing up – Radical Changes in next 5-10 yrs

- Medical and Information Technology will continue to evolve in ways that blur lines between our old ideas
 - ✓ when is a computer (or when is software) a medical device?
 - ✓ medical equipment manufacturers will primarily focus on software that will be hardware platform agnostic
 - ✓ future of clinical data analysis and storage is in cloud
- Rapid technology innovations will place increasing burdens on
 - ✓ regulators who are challenged to regulate effectively without stifling innovation
 - ✓ healthcare organizations who are financially constrained but want new technology in order to effectively compete for patients
 - ✓ existing CE & IT infrastructures that must collaborate, acquire new tools and learn to prioritize in order to address greatest risks if they hope to support new technologies (e.g., ITIL, vulnerability assessments, risk & security management)

CE/HTM Professional Roles in Healthcare Delivery: Time for a Trajectory Reset?

Stephen Grimes

Since the early days of clinical engineering (CE) and healthcare technology management (HTM), the focus has been on ensuring the necessary support and availability of effective and safe healthcare technology. Viewed another way, the nature of what is required to ensure the support and availability of effective and safe healthcare technology is at the core of what constitutes an effective CE/HTM role. Therefore, fundamental changes in CE/HTM services and its associated support needs require corresponding changes in knowledge, skills, and abilities (KSAs) needed by these professionals.

A Critical Point
Healthcare technology continues to evolve, as exhibited by developments in areas such as robotics, three-dimensional (3D) imaging and printing, telemedicine and remote monitoring, micro- and nanotechnologies, individualized medicine (including use of genomics), connected systems of systems, cloud-based solutions (e.g., the Internet of Things, 5G), clinical decision support, artificial intelligence (AI), virtual reality (VR), and augmented reality (AR). These new technologies tend to be increasingly complex and capable and, oftentimes, even disruptive. Consequently, they bear little resemblance to their technical ancestors. When viewed on a time scale, the evolution of technology appears exponential (Figure 1).

The implications of this exponential evolution of healthcare technology on CE/HTM professionals will be substantial. Successful HTM professionals will occur only if CE/HTM professionals are substantively involved in both the selection and life cycle support of changing technologies. Successful CE/HTM professionals will adapt to match the evolving needs of new technologies.

To take on the requisite support role, CE/HTM professionals must be prepared to:

- Recognize that their past and existing KSAs may be inadequate to support the new and coming generations of healthcare technology.
- Commit to the continuous acquisition of technology.
- Commit to ensure their ability to support new and continuously evolving technologies.

For most CE/HTM professionals, this will necessitate a reset and acceleration of the acquisition of KSAs (Figure 2). A reset is necessary because many of the KSAs currently possessed by CE/HTM professionals are based on the perceived support needs of past generations of healthcare technology. A broad examination of support needs provided today by the bulk of CE/HTM professionals would suggest that a

perceive the need or adopt practices. Consequently, some critical competencies may receive inadequate or no attention. Examples of some currently critical but often overlooked competencies include:

- Quality management systems
- Systems engineering (e.g., design, integration, configuration, and management) of systems of systems
- Cybersecurity (i.e., data integrity, availability, confidentiality) management, preparedness, and response
- Compliance (e.g., regulations, accreditation, and authorities having jurisdiction)
- Incident/problem and knowledge base management
- Data analytics (e.g., wireless/transmission integrity, life cycle management, network management, updates, recalls)
- Software management (e.g., maintenance, diagnostics, troubleshooting, updates)
- Asset management systems (e.g., computerized maintenance management systems, configuration database management systems)
- Specializations (e.g., imaging, chemistry, optics, micro- and nanotechnologies, printing, AI, VR, and AR systems)

competencies could appear in one or more professional categories. Division of these technology managers are responsible for managing operations, training, monitoring, analyzing data, and maintaining healthcare and to ensure the health-care industry has the necessary support and maintenance for the current and future technologies. They also reflect the needs of other industries.

organizations (RPOs), manufacturers, and service providers to determine course-of-action for establishing and sustaining competency (i.e., manage current and future competencies) in each category of professional category.

- Educate

including individuals may occasionally occur, but the more the CE/HTM professionals can plan for the future, the more likely they will be able to support the healthcare technological evolution.
